Bengaluru, Karnataka

Experience

Software Development Engineer I

Bengaluru, Karnataka

Osfin.ai

February 2026 - Present

- Built backend workflows for dispute and chargeback processing across **UPI, IMPS, AEPS, and CBDC**, enforcing payment-network rules, user permissions, deadlines, and auditable state transitions.
- Automated bulk complaint creation from CSV files, replacing one-at-a-time processing with row-level validation, configurable reason mapping, and fault isolation so invalid records do not block an entire upload.
- Prevented duplicate financial operations during concurrent and stale requests by combining application-level pre-validation with database uniqueness constraints and deterministic error handling.
- Improved batch-platform resilience by adding retry paths and safe recovery for stuck execution states, operational health probes, and backward-compatible **Liquibase** migrations.
- Redesigned a shared filter-data pipeline to correctly query heterogeneous tables and database views while preserving source-specific configuration, reducing failure-prone branching and simplifying maintenance.
- Integrated **IDFC Bank's CBS Hold APIs** for balance enquiry, hold placement, recovery, and removal, with validation, downstream failure handling, and reconciliation support.
- Resolved production incidents across payment, batch, and external-integration services through log correlation, database investigation, and controlled fixes; diagnosed **Kubernetes** pod, configuration, health-check, and service-connectivity failures.

Software Engineer I

Hyderabad, Telangana

E-Ring Inc.

July 2025 - November 2025

- Re-architected a county-wide ETL workflow using BCP-driven pipelines, reducing processing time for **1M+ records** from **8 hours to 45 minutes**.
- Developed T-SQL monitoring and reconciliation scripts for billing workflows, reducing manual validation effort and improving audit readiness.

Projects

PokerNight - Real-Time Multiplayer Poker (Java 21, Spring Boot, WebSockets/STOMP)

- Architected a **multi-room, server-authoritative platform** with framework-free game-engine, application, persistence, and transport modules connected through explicit ports and immutable contracts.
- Implemented the complete Texas Hold'em lifecycle: secure dealing, forced blinds, betting streets, folds, raises, all-ins, side pots, showdown evaluation, dealer rotation, and **chip-conservation invariants**.
- Designed **per-room command serialization**, 24-hour idempotency receipts, and reconnect snapshots to preserve correctness under concurrent actions, duplicate network delivery, and browser refreshes.
- Built authenticated REST and **WebSocket/STOMP** boundaries with public room topics and private player queues, preventing hole-card and turn-state leakage across users.
- Implemented a decoupled **bot lifecycle and decision adapter**; bots consume immutable turn contexts and submit decisions through the same validated command path as human players.
- Packaged the React client and Spring Boot API as one deployable JAR, with optional atomic JSON recovery, Docker/Actuator operations, and Playwright coverage across Chromium and iPhone WebKit.

Scalable URL Shortener (TypeScript, Node.js, Redis, REST APIs)

- Built a redirect service with **Redis-backed caching** to separate the latency-sensitive read path from URL creation and persistence.
- Separated URL creation and redirect resolution into focused REST API paths, keeping request handlers stateless and independently deployable.
- Implemented **token-bucket rate limiting** to protect public APIs while retaining stateless request handling.
- Designed collision-safe short-code generation, input validation, and secure redirect flows behind REST APIs.

Certifications

- Selected Generative AI Coursework - Coursera:** RAG applications, vector databases and retrievers, multimodal AI applications, and AI agents using MCP

Education

Indian Institute of Technology Roorkee (IIT Roorkee)

Uttarakhand, India

Bachelor of Technology (BTech) - Mechanical Engineering

Nov 2021 - May 2025

Highlights

- Secured **Global Rank 263** in CodeChef Starters 215, competing among 25,000 programmers ([CodeChef Link](#)).
- Winner, StackTooDeep Hackathon, Blockchain Society, IIT Roorkee ([Devfolio Link](#)).
